

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings of claims in the application:

LISTING OF CLAIMS:

1-18 (cancelled)

19 (new): A method of manually centering, in a rim (200) of a spectacles frame, an ophthalmic lens (103) that is provided with at least one center and/or axis marking (PC), the method comprising the steps consisting in:

a) for calibration purposes, acquiring and storing the shadow of an opaque sign (124A ; 124B) formed on a transparent sign support (124) interposed between lighting means (S) and acquisition means (C) while said support is being illuminated on its own by said lighting means;

b) superposing said ophthalmic lens and said transparent sign support;

c) acquiring and storing the shadow of said opaque sign of said support as detected by said ophthalmic lens while said ophthalmic lens and said support are being illuminated together by said lighting means;

d) using the acquisition means (C) to acquire the shadow of the center and/or axis marking (PC) of the ophthalmic lens (103) for centering while it is illuminated by said lighting means;

e) displaying on a display screen (105) firstly the shadow of the center and/or axis marking (PC) of the ophthalmic lens (103), and secondly a virtual centering target (CC) corresponding to the position desired for the center marking (PC) of the lens (103) relative to a reference point (CB) of the rim (200) of the frame;

f) from the prismatic deflection of the opaque sign (124A; 124B) as measured by comparing the acquisitions of steps a) and c), deducing a corrected relative position (CBc) for the reference point (CB) of the frame rim (200) relative to the center marking (PC), or vice versa; and

g) putting the shadow of the centering marking (PC) of the ophthalmic lens (103) into coincidence with the centering virtual target (CC).

20. (new): A centering method according to claim 19, characterized in that steps c) to f) are performed in a loop after performing steps a) and b), so as to continuously obtain a corrected relative position (CBc) for the reference point (CB) of the frame rim (200).

21. (new): A centering method according to claim 20, characterized in that in step c), the shadow of the outline of the ophthalmic lens (103) for centering is acquired and in step d) there is displayed on the display screen (105) firstly said shadow of the outline of the lens (103) and secondly a virtual image (200) representative of the corresponding rim of the frame, being offset independently of the reference point (CB) of said frame rim relative to the centering virtual target (CC) associated with said frame rim in order to compensate for the prismatic deflections induced by the lens (103) for centering.

22. (new): A centering method according to claim 19, characterized in that steps d) and e) are performed in a loop, following steps a) and b), and steps c) and f) are performed after step g).

23. (new): A centering method according to claim 19, characterized in that in step e), there is displayed on the

display screen (105), firstly directly from the acquisition and analysis means (C), the shadows of the ophthalmic lens (103) for centering, of the center and/or axis marking (PC) of said ophthalmic lens (103), and of the opaque sign (124A; 124B) while it is being activated, and secondly the centering virtual target (CBc), the opaque sign (124A ; 124B) of the transparent sign support (124) being activated intermittently for a duration that is short enough to ensure that the human eye does not perceive its shadow on the display screen.

24. (new): A method of centering and blocking an ophthalmic lens, the method comprising centering said lens using the method according to claim 19, and depositing a handling peg at a predetermined location on said ophthalmic lens, account being taken of the corrected position (CBc) of the reference point (CB) of the frame rim (200) as calculated in step f).

25. (new): A centering and blocking device for implementing the method according to claim 24, the device comprising:

- receiver means (121, 114) for receiving the ophthalmic lens (103);
- on either side of said receiver means, firstly lighting means (S) for illuminating the ophthalmic lens (103) installed on said receiver means, and secondly acquisition and analysis means (C) for acquiring and analyzing the light transmitted through said ophthalmic lens; and
- a transparent support (124) including an opaque sign representing a geometrical figure presenting a maximum outside dimension lying in the range 2 mm to 10 mm, that is activatable and deactivatable, and that is disposed between said receiver means and said acquisition and analysis means.

26. (new): A device according to claim 25, characterized in that the geometrical figure (124B) occupies an area lying in the range 3 mm² to 80 mm².

27. (new): A device according to claim 25, characterized in that the geometrical figure (124B) is of a shape that is different from a point or a cross, being suitable for being distinguished visually from a marking on the ophthalmic lens.

28. (new): A device according to claim 25, characterized in that the geometrical figure (124B) is a polygon, preferably a triangle.

29. A device according to claim 25, characterized in that the geometrical figure is a circle or an oval.

30. A device according to claim 25, characterized in that said receiver means, said lighting means, said acquisition and analysis means, and said transparent sign support are held stationary relative to one another.

31. A device according to claim 25, characterized in that it includes a single optical path between said lighting means (S) and said acquisition and analysis means (C).

32. A device according to claim 25, characterized in that said transparent sign support (124) is a transparent active screen suitable for selectively displaying the geometrical figure.

33. A device according to claim 32, characterized in that said transparent screen is a liquid crystal screen.

34. A device according to claim 25, characterized in that said transparent sign support comprises a regular array of repeated opaque patterns.

35. A device according to claim 34, characterized in that said transparent sign support comprises a Hartmann matrix.
